

New transistor radios show capability of nanotube technology

By James E. Kloeppel
News Bureau Staff Writer

Carbon nanotubes have a sound future in the electronics industry, say researchers who built the world's first all-nanotube transistor radios to prove it.

The nanotube radios, in which nanotube devices provide all of the active functionality in the devices, represent "important first steps toward the practical implementation of carbon-nanotube materials into high-speed analog electronics and other related applications," said John Rogers, a Founder Professor of Materials Science and Engineering at the UI.

Rogers is a corresponding author of a paper that describes the design, fabrication and performance of the nanotube-transistor radios, which were achieved in a close collaboration with radio frequency electronics engineers at Northrop Grumman Electronics Systems in Linthicum, Md.

The paper has been accepted for publication in the Proceedings of the National Academy of Sciences, and was to be published in PNAS Online Early Edition this week.

"These results indicate that nanotubes might have an important role to play in high-speed analog electronics, where benchmarking studies against silicon indicate significant advantages in comparably scaled devices, together with capabilities

that might complement compound semiconductors," said Rogers, who also is a researcher at the Beckman Institute and at the university's Frederick Seitz Materials Research Laboratory.

Practical nanotube devices and circuits are now possible, thanks to a novel growth technique developed by Rogers and colleagues at the UI, Lehigh and Purdue universities, and described last year in the journal *Nature Nanotechnology*.

The growth technique produces linear, horizontally aligned arrays of hundreds of thousands of carbon nanotubes that function collectively as a thin-film semiconductor material in which charge moves independently through each of the nanotubes. The arrays can be integrated into electronic devices and circuits by conventional chip-processing techniques.

"The ability to grow these densely packed horizontal arrays of nanotubes to produce high current outputs, and the ability to manufacture the arrays reliably and in large quantities, allows us to build circuits and transistors with high performance and ask the next question," Rogers said. "That question is: 'What type of electronics is the most sensible place to explore applications of nanotubes?' Our results suggest that analog RF (radio frequency) represents one such area."

nique and today's nanotube analog potential, Rogers and collaborators at the UI and Northrop Grumman fabricated nanotube transistor radios, in which nanotube devices provided all of the key functions.

The radios were based on a heterodyne receiver design consisting of four capacitively coupled stages: an active resonant antenna, two radio-frequency amplifiers, and an audio amplifier, all based on nanotube devices. Headphones plugged directly into the output of a nanotube transistor. In all, seven nanotube transistors were incorporated into the design of each radio.

In one test, the researchers tuned one of the nanotube-transistor radios to WBAL-AM (1090) in Baltimore, to pick up a traffic report.

"We were not trying to make the world's tiniest radios," Rogers said. "The nanotube radios are a demonstration, an important milestone toward building the technology into a form that ultimately would be commercially competitive with entrenched approaches."

The work was funded by the National Science Foundation and the U.S. Department of Energy. ♦

Faculty retreat aims to enhance teaching and learning

By Sharita Forrest
Assistant Editor

More than 250 faculty members and instructors met at the Illini Union on Jan. 31 for the 14th annual Faculty Retreat, titled "Using the Science of Instruction to Foster

to hear Peter Doolittle because they are currently teaching our undergraduate students and are the future professoriate," said Cheelan Bo-Linn, head of instructional development in the Center for Teaching Excellence. "They will be able to implement

Four new teaching certificates to be offered

The Center for Teaching Excellence is offering four new teaching certificates to address faculty members' and teaching assistants' professional development needs and interest in teaching excellence and enhancing student learning. For many years, the CTE has offered a Graduate Teacher Certificate for TAs, and this year the center has developed sever-
